

AMENDMENTS TO THE CLAIMS

- At the time of the Action: Claims 1-46 were canceled, claims 59-62 were withdrawn, and claims 47-58 and 63-66 were pending.
- Amended Claims: Claims 47 and 63.
- Canceled Claims: Claims 48-50 and 64.
- New Claims: None.
- After this Response: Claims 47, 51-58, 63, 65 and 66 are pending.

1-46. (Canceled).

47. (Currently Amended) An electrostatic imaging process comprising:

(A) forming a charged latent electrostatic image on a photo conductive surface; and

(B) applying to the photoconductive surface toner particles from a liquid toner, thereby forming an image, wherein the liquid toner comprises:

(a) an insulating non-polar carrier liquid;

(b) at least one charge director; and

(c) toner particles dispersed in the carrier liquid and the at least one charge director, the particles comprising:

(i) a core material comprising a pigmented polymer suitable for use as a toner material in an electrostatic image development application, [[-]]which is unchargeable by the at least one charge director or which is weakly chargeable by the at least one charge director;

(ii) a coating of at least one ionomer component in an amount effective to impart an enhanced chargeability to the toner particles to an extent that the particles can be used to develop a latent electrostatic image in the electrostatic image development application;

(iii) wherein the coating of the at least one ionomer added to the toner particles ~~in a first and a second liquid toner is sufficient to result in the same chargeability for toner particles within the first and second liquid toner~~results in a same chargeability for colors of the pigmented polymer; and

(iv) wherein the coating of the at least one ionomer increases the chargeability of the toner particles to ~~less than or equal to~~ about 103 pmho/cm.

48. (Canceled).

49. (Canceled).

50. (Canceled).

51. (Previously Presented) The electrostatic imaging process of Claim 47 wherein the at least one ionomer is carboxylic acid based and neutralized with metal salts forming ionic clusters.

52. (Previously Presented) The electrostatic imaging process of Claim 47 wherein the at least one ionomer is methacrylic acid based and neutralized with metal salts forming ionic clusters.
53. (Previously Presented) The electrostatic imaging process of Claim 47 wherein the at least one ionomer is sulfonic acid based and neutralized with metal salts forming ionic clusters.
54. (Previously Presented) The electrostatic imaging process of Claim 47 wherein the at least one ionomer is phosphoric acid based and neutralized with metal salts forming ionic clusters.
55. (Previously Presented) The electrostatic imaging process of Claim 47 wherein the at least one ionomer is ethylene based and neutralized with metal salts forming ionic clusters.
56. (Previously Presented) The electrostatic imaging process of Claim 47 wherein the coating comprises less than 20 percent of the weight of the particles.

57. (Previously Presented) The electrostatic imaging process of Claim 47 wherein the coating comprises a thickness greater than or equal to a monolayer of the at least one ionomer.
58. (Previously Presented) The electrostatic imaging process of Claim 47 wherein the coating comprises a thickness of greater than 0.02 micrometers.
59. (Previously Withdrawn) An electrostatic imaging system, comprising:
- (A) a photo conductive surface configured to allow charging to define a latent electrostatic image thereon; and
 - (B) toner particles from at least first and second liquid toners, applied to the photoconductive surface to form an image of at least two colors, wherein the first and second liquid toners comprise differently colored pigments and wherein each of the first and the second liquid toners comprises:
 - (a) an insulating non-polar carrier liquid;
 - (b) at least one charge director; and
 - (c) toner particles dispersed in the carrier liquid and the at least one charge director, the particles comprising:
 - (i) a core material comprising a pigmented polymer suitable for use as a toner material in an electrostatic image development application, but which is unchargeable by the at least one charge director or which is

chargeable by the at least one charge director to less than or equal to 103 pmho/cm; and

(ii) a coating of at least one ionomer component in an amount effective to impart enhanced chargeability to the toner particles to an extent that:

(a) the particles can be used to develop a latent electrostatic image in the electrostatic image development application; and

(b) the polarity of the toner particles is reversed;

(iii) wherein the coating of the at least one ionomer added to toner particles in each of the first and second liquid toners is sufficient to result in similar chargeability for toner particles within the first and second liquid colors.

60. (Previously Withdrawn) The electrostatic imaging system of Claim 59, wherein the core material is chargeable by the at least one charge director to less than or equal to 86 pmho/cm.

61. (Previously Withdrawn) The electrostatic imaging system of Claim 59, wherein the core material is chargeable by the at least one charge director to less than or equal to 7 pmho/cm.

62. (Previously Withdrawn) The electrostatic imaging system of Claim 59, wherein imparting enhanced chargeability comprises enhancing the chargeability of the core material with the coating by an order of magnitude over chargeability of the core material without the coating.

63. (Currently Amended) Liquid toners for an electrostatic imaging, comprising:

(A) at least first and second liquid toners of first and second colors, wherein the first and the second liquid toners are configured with pigmented polymers having differently colored pigments and wherein each of the first and the second liquid toners comprises:

(a) an insulating non-polar carrier liquid;

(b) at least one charge director; and

(c) toner particles dispersed in the carrier liquid and the at least one charge director, the particles comprising:

(i) a core material comprising a pigmented polymer suitable for use as a toner material in an electrostatic image development application, which is unchargeable by the at least one charge director or which is weakly chargeable by the at least one charge director;

(ii) a coating of at least one ionomer component in an amount effective to impart an enhanced chargeability to the

toner particles to an extent that the particles can be used to develop a latent electrostatic image in the electrostatic image development application;

(iii) wherein the coating of the at least one ionomer added to toner particles in each of the first and the second liquid toners is sufficient to result in ~~[[similar]]~~ a same chargeability for toner particles within the first and the second liquid toners; and

(iv) wherein the coating of the at least one ionomer increases the chargeability of the toner particle ~~less than or equal to~~ about 103 pmho/cm.

64. (Canceled).

65. (Previously Presented) The liquid toners of Claim 63, wherein imparting enhanced chargeability comprises enhancing the chargeability of the core material with the coating by an order of magnitude over chargeability of the core material without the coating.

66. (Previously Presented) The liquid toners of Claim 63, wherein the coating is used in an amount effective to reverse a polarity imparted on the toner particle by the charge director.
